

Client Change Request (CCR)**CCR Number:** CCR-011**Client:** National Technology Conference**Submitted By:** Michelle Adams, Conference Coordinator**Priority:** Medium**Requested Delivery:** End of Today's Sprint**Assigned Developer:** _____**Date Assigned:** _____

Business Background

The National Technology Conference hosts several professional conferences throughout the year. Each conference has a list of presenters who will be speaking during the event. Before each conference begins, the event coordinator needs to review the list of presenters to verify that everyone has been scheduled correctly.

Currently, the coordinator starts the software and manually types each presenter's name every time the program runs. Since the presenter list is already known before the conference begins, this repetitive data entry wastes time and occasionally introduces typing errors.

The Conference Coordinator would like a computer program that receives the presenter names when the program is launched. After the program starts, it should display the list of presenters, report how many presenters are participating, and identify the presenter whose name contains the greatest number of characters.

At this time, the program only needs to process one conference during each execution.

Customer Requirements

The conference coordinator wants the presenter names to be supplied when the program starts rather than entering them interactively.

The program should:

- Display every presenter that was supplied.
- Count the total number of presenters.
- Determine which presenter's full name contains the greatest number of characters.
- Display the longest presenter name.

The report should be clearly formatted and easy to read.

Acceptance Criteria

The customer will consider the software complete when all of the following are true.

- ☐ Presenter names are supplied when the program starts.
 - ☐ Program correctly displays every presenter.
 - ☐ Program correctly counts the total number of presenters.
 - ☐ Program correctly determines which presenter has the longest name.
 - ☐ Program displays the longest presenter's name.
 - ☐ Program produces a neat and professional report.
 - ☐ Program completes without errors.
-

Out of Scope

The customer is **not** requesting:

- Typing presenter names after the program starts
- Saving presenter information to a file
- Sorting presenter names alphabetically
- Editing presenter information
- Removing duplicate presenter names
- Displaying presentation topics
- Assigning presentation times
- Supporting multiple conferences during one execution
- Graphical user interfaces (GUI)

If these features appear in the software, they will not be evaluated.

Example Scenario 1

Program Execution

conference.exe "Alice Johnson" "Brian Smith" "Emily Brown"

Expected Output

National Technology Conference

Presenter Summary

Presenters

1. Alice Johnson
2. Brian Smith
3. Emily Brown

Total Presenters : 3

Longest Name : Alice Johnson

Characters : 13

Example Scenario 2

Program Execution

conference.exe "Christopher Anderson" "Mary Jones" "John Lee" "Amanda Carter"

Expected Output

National Technology Conference

Presenter Summary

Presenters

1. Christopher Anderson
2. Mary Jones
3. John Lee
4. Amanda Carter

Total Presenters : 4

Longest Name : Christopher Anderson

Characters : 22

Example Scenario 3

Program Execution

conference.exe "David Miller"

Expected Output

National Technology Conference

Presenter Summary

Presenters

1. David Miller

Total Presenters : 1

Longest Name : David Miller

Characters : 12

Notes from the Customer

"Our presenter lists are already available before the conference begins. I don't want employees retyping names every time the program starts because that wastes time and increases the chance of typing mistakes. I simply want the program to use the names that were supplied when it was launched and provide a quick summary of the conference speakers."

Developer Notes

This section intentionally left blank.

Students will complete the software requirements during class before beginning implementation.

Questions for the Customer

Before writing any code, list any questions you would ask the customer to clarify the request.

Examples:

- 1.

Reminder

The customer has intentionally described the problem using **business language**, not programming terminology. During class, your first task is to translate these customer requirements into **software requirements** before writing any C code.

For this assignment, you should use only the C language features that have been covered through **Lesson 11**, including:

- Variables and constants
- Input/output
- Formatted output
- Functions
- Pointers
- Strings and string library functions
- Arrays of strings
- Command-line arguments (argc and argv)

Do **not** use C language features that have not yet been introduced in the course.
